

# Artificial Intelligence-The Lack of Privacy

SPÎNU LAVINIA

Artificial intelligence, which is demonstrated by machines, is beginning to be more common nowadays. It evolved and is getting more hard to compare it with human intelligence even though was the one who create it. This progression leads to new challenges and one of them is the intruding of our privacy.

Some of the skills that were successfully developed in artificial intelligence are to understand human speech, face recognition, to compete at the highest level in strategic game systems and autonomously operating cars. At first sight they seem harmless even useful. They are but for those who need to collect valuable information from us. The progression of artificial intelligence magnified the ability to use personal information at the point that we are lack of privacy. Thanks to the skills that I mentioned before, we can be easily indentified and is harder to hide or to be anonymous. Our personal data can be accessed by anyone with high abilities in hacking and we can be exposed easily if we don't have enough knowledge in the IT world to protect ourselves.
